

HOSPITAL DATASET

Screen shorts of dashboards and key insights from each dashboard o business recommendations.

DASHBOARD 1.

Dashboard 1: Hospital Overview

Key Insights

- The total number of patients is increasing / stable over time (update based on your data).
- Certain months show higher admissions, indicating a **seasonal trend**.
- Some departments (e.g., Cardiology, Neurology) handle a higher number of patients.
- A few cities contribute to the majority of hospital admissions.
- The average length of stay is moderate/high, indicating treatment duration patterns.

Business Recommendations

- Allocate more staff and resources to high-patient departments.
- Plan in advance for peak admission months.
- Expand hospital facilities in high-admission cities.
- Optimize treatment processes to reduce length of stay.

DASHBOARD 2.

Dashboard 2: Disease Analysis

Key Insights

- Certain diseases (e.g., Heart Disease, Diabetes) are more common.
- Some diseases have significantly higher treatment costs.
- Recovery rates vary across different diseases.
- Certain departments specialize in treating specific diseases.

Business Recommendations

- Implement preventive healthcare programs for common diseases.
- Introduce cost-control strategies for high-cost treatments.
- Improve treatment protocols for diseases with low recovery rates.
- Strengthen specialized departments for better care delivery.

DASHBOARD 3.

Dashboard 3: Doctor & Department Performance

Key Insights

- Some doctors handle a higher number of patients than others.
- Recovery rates differ significantly among doctors.
- Higher average length of stay for some doctors may indicate lower efficiency.
- Certain departments incur higher treatment costs overall.

Business Recommendations

- Recognize and reward high-performing doctors.
- Provide training and support for lower-performing doctors.
- Share best practices across departments.
- Monitor and optimize department-level costs.

DASHBOARD 4.

4: Patient Journey & Outcomes

Key Insights

- Admission vs discharge trends show patient flow patterns (balanced or delayed).
- A majority of patients are recovered / under treatment / expired (update based on your data).

- Treatment costs vary significantly across cities and states.
 - Certain regions show higher healthcare demand.
-

Business Recommendations

- Improve discharge processes to increase bed availability.
- Enhance treatment quality to improve recovery rates.
- Review pricing strategies in high-cost cities.
- Expand infrastructure in high-demand regions.

Final Conclusion

- Data analysis provides clear visibility into hospital performance.
- Interactive dashboards support better decision-making.
- There is strong potential to improve efficiency, reduce costs, and enhance patient outcomes.
